

Complete Evidence-Based Model Answers • Q1 + Q2 + Q3 • with Active-Recall Pack
Proctored Online Examination • July Semester 2025 (14 Nov 2025)

SUSS • SWK501 HUMAN LIFESPAN & SOCIAL ECOLOGY

The Complete July 2025 POE Model Answers & Active-Recall Pack

Q1 (50 marks) — Mr & Mrs Tan and their two young-adult children: Erikson, developmental factors, emerging adulthood, and a dual-focus plan (Arnett + Bandura)

Q2 (30 marks) — multiple intelligence vs IQ (Gardner & Sternberg), and a “combo” way forward in the Singapore education system

Q3 (20 marks) — appraising “empty-nest syndrome” for midlife couples, their children, and community

One exam-ready compendium: full-distinction model answers with APA citations, rapid-revision matrices, and a printable flashcard + quiz pack — grounded in longitudinal, meta-analytic and official Singapore evidence.

ORIENTATION

How to use this compendium — and one accuracy note

This document compiles evidence-based model answers to the three compulsory questions of the SWK501 **July 2025** Proctored Online Examination (Q1 = 50 marks; Q2 = 30 marks; Q3 = 20 marks; 100 total), followed by an active-recall pack. Each answer follows the SUSS marking hallmarks: multidimensional, non-deterministic reasoning; explicit theory with named authors; and Singapore-grounded application.

***Accuracy note:** the “frontier prompt template” in the master study guide lists Q3 as SOC / late-adulthood cognition. The official July 2025 POE controls, and its Q3 is the **empty-nest syndrome** (20 marks). This compendium follows the official paper. (SOC / cognition in late adulthood belongs to the January 2025 paper, answered in a separate document.)*

- **Section 1** answers Q1a–d (Erikson; developmental factors with **Bandura self-efficacy**; **Arnett** emerging adulthood; dual-focus intervention).
- **Section 2** answers Q2 (IQ vs Gardner vs Sternberg) and proposes an integrated “**combo**” for Singapore schools.
- **Section 3** answers Q3 (empty-nest appraisal for couple, children, community).
- **Sections 4–6:** rapid revision; flashcards + MCQ quiz with answer key; APA references.

KEY TAKEAWAY — Treat every age-graded transition as probabilistic and culturally situated. Behaviour is a product of person, developmental history, current psychology, relationships, institutions, culture, and material opportunity — never age or personality alone.

QUESTION 1 • 50 MARKS

Mr & Mrs Tan and their two young-adult children

The parents, in their early 60s, are frustrated with their 27-year-old son and 25-year-old daughter. The son does ad hoc work with no permanent job; the daughter is not working and appears uninterested; neither plans to move out or marry despite intermittent relationships; the parents report rudeness and no contribution to household bills.

Q1a — Erikson's psychosocial crisis (5 marks)

The applicable crisis is Intimacy versus Isolation. For Erikson, young adulthood centres on forming enduring, mutually committed relationships without losing a coherent sense of self. Longitudinal research supports part of Erikson's sequence: identity consolidation at 24 mediated the link between earlier ego development and romantic intimacy at 25 (Beyers & Seiffge-Krenke, 2010), while cautioning against an inflexible stage order.

- **The 27-year-old son:** repeated in-and-out relationships may indicate he is still negotiating commitment and mutuality; unstable vocational identity can make intimate/relational planning harder. Being unmarried is *not* “isolation” — citizen men first married at a median age of 30.8 in 2024 (SingStat, 2024).
- **The 25-year-old daughter:** the absence of a stable romance may reflect ongoing exploration rather than pathology; employment difficulty can affect confidence and readiness to commit. The 2024 median first-marriage age for citizen women was 29.1 (SingStat, 2024) — above her current age.
- **A sophisticated formulation:** unresolved *identity* work overlaps with the current *intimacy* task — both children are simultaneously deciding work, autonomy, relationships and family responsibilities.

KEY TAKEAWAY — At 25/27, Intimacy vs Isolation is the right lens — but intimacy is the capacity for reciprocal commitment, not whether one is already married. Do not diagnose “isolation” from marital status.

Q1b — Physical, psychological and social factors (15 marks)

The behaviours are best explained as the product of interacting biophysical, psychological, relational, labour-market, housing and cultural influences. No single factor is sufficient; the vignette supplies limited evidence, so several factors are *assessment hypotheses*, not diagnoses.

Dimension	Factor	Case analysis & research
Biophysical	Neurocognitive maturation	A large multi-dataset study (Nature Communications, 2023) found the executive functions it measured largely stabilised at adult levels around ages 18–20. The cliché “the brain isn't mature until 25” should not excuse financial or interpersonal behaviour.
Physical / health	Sleep, illness, substance use	Could affect motivation and regulation, but none is stated — assess, don't assume.
Psychological	Vocational identity & self-efficacy	Career self-efficacy is longitudinally linked to more vocational exploration and commitment (Lee, Song, & Rhee, 2020). Low career self-efficacy is a strong candidate for the daughter's avoidance (see Bandura panel below).
Psychological	Identity exploration	They may still be deciding what to commit to — common but highly heterogeneous in the twenties (Arnett, 2000).
Relational	Autonomy vs dependence	Rude exchanges may reflect an unresolved renegotiation of authority — parents expecting compliance, young adults expecting autonomy.
Social / structural	Housing	An unmarried single generally must be 35 to buy an HDB flat independently (singles route; HDB/CPF). Expecting a 25/27-year-old to simply “get their own house” ignores a major local constraint.
Social / labour	Employment	Resident unemployment at 25–34 was 3.3% in 2024 (MOM), so persistent joblessness is not the age norm; ad hoc/platform work is now formally recognised (Platform Workers Act, 2025) and should be assessed, not dismissed.
Social / cultural	Marriage timing & filial norms	Unmarried at 25/27 is unremarkable (medians 30.8 / 29.1; SingStat, 2024). Singapore retains norms of upward support, but patterns vary (Kim, 2024).

Bandura's social-cognitive lens (apply explicitly). Self-efficacy — a task-specific belief in one's capability — is built from four sources (Bandura, 1997): **mastery/enactive experiences** (the strongest), **vicarious experiences** (similar others succeeding), **verbal/social persuasion**, and **physiological/affective states**. The daughter's job avoidance may reflect low career self-efficacy produced by repeated failed applications (weak mastery), few relatable role models (weak vicarious), discouraging feedback (negative persuasion) and job-search anxiety (adverse affect). By **triadic reciprocal determinism**, her withdrawal (behaviour) invites parental criticism (environment), which further lowers efficacy (person) — a self-reinforcing loop the intervention must break.

KEY TAKEAWAY — Explain behaviour through interacting biophysical + psychological (self-efficacy) + social/structural factors, and state where the case gives no evidence. Reject the “brain not mature till 25” excuse.

Q1c — Emerging adulthood (20 marks)

Arnett (2000) proposed emerging adulthood to describe a period after adolescence but before durable adult roles, concentrated in the late teens through the twenties (originally especially 18–25) and explicitly **culturally contingent**. Nelson's (2021) 20-year review stresses heterogeneity — the period can bring opportunity or difficulty rather than a uniform trajectory.

Feature	Meaning	Tan-case application	Critical caution
Identity exploration	Trying alternatives in love/work/worldview	Ad hoc work; uncertain employment; multiple relationships	Exploration needs actual engagement, not inactivity
Instability	Change in plans, roles, residence	Temporary work; changing relationships	Chronic instability can undermine identity synthesis
Self-focus	Relative freedom from permanent obligations	Limited household contribution	Not the same as selfishness; cannot excuse disrespect
Feeling in-between	Adult yet not subjectively fully adult	Adult age but co-residing and partly dependent	Intensified by Singapore housing structures
Age of possibilities	Multiple futures remain open	Career/relationship experimentation	Possibility without action becomes avoidance

- **Singapore relevance:** Yeo and Yang (2023) found all five features salient among 757 Singapore youths, with work/study most salient — but the sample averaged 19.6 years and was studied at COVID's onset, so it cannot simply generalise to 25/27-year-olds.
- **Structural mechanisms:** the HDB singles rule (age 35) makes the Western marker of “moving out in the early twenties” institutionally less available; later marriage (medians 30.8/29.1) further reduces the significance of being unmarried now.
- **Limitations:** the theory is non-universal (class, culture, obligation), *descriptive not causal*, and its age band is approximate — the son at 27 sits beyond the original core range; it must not normalise persistent withdrawal (3.3% unemployment shows joblessness is not the age norm).

KEY TAKEAWAY — Apply all five features, then evaluate: Arnett is culturally contingent and descriptive, and Singapore housing, employment and marriage norms reshape how it appears. It is a strong partial explanation, not a complete one.

Q1d — Dual-focus intervention plan (10 marks)

A **Tan Family Adult-Transition Plan** works simultaneously on the young adults' capacities/choices **and** the family/structural conditions sustaining conflict, shifting the parents from a **directive to a consultative** stance: understand before judging → negotiate adult responsibilities → connect development with structural resources.

Person-focused work

- **With the parents — psychoeducation:** validate their worries, then reframe (unmarried at 25/27 is normative; co-residence partly reflects the housing system; emerging adulthood involves exploration but still requires reciprocity). Coach the move from “become what we expect” to “how do we live fairly together while you build independence?”
- **With each young adult — assess** career goals and actual job-search behaviour, self-efficacy, skills, health, mood, finances, relationship goals, and readiness for responsibility (assessment, not diagnosis).

Build career self-efficacy through Bandura's four sources (the engine of Q1d): *mastery* — graded, winnable steps (short courses, temp/internship placements, a structured weekly application target); *vicarious* — near-peer models and WSG Volunteer Career Advisors who resemble the young adults; *verbal/social persuasion* — credible coaching with genuine feedback, not empty praise; *physiological/affective* — manage job-search anxiety and reframe arousal. Refer the daughter to WSG Careers Connect for assessment, exploration, planning and coaching.

Environment-focused work

- **Adult household agreement** (written, reviewable): respectful communication; *capacity-based* financial contribution (employed son a modest agreed sum; unemployed daughter more chores while job-seeking); specific tasks; weekly employment actions; privacy; a realistic multi-year housing plan; marriage not a condition of adult recognition; monthly review. The principle is **reciprocity** — more autonomy paired with more responsibility.
- **Housing education:** explain the age-35 singles rule and redefine “successful launching” as financial independence, contribution, decision-making, vocational direction and respectful adult relationships — not the physical act of leaving.
- **Support the parents' own transition:** protect retirement savings, set a sustainable support ceiling, rebuild couple activities, and avoid tying their well-being to their children meeting a timetable.

Evaluation (~3 months): conflict frequency/intensity; job-search actions and progress; contribution to bills/chores; adherence to communication boundaries; parents' perceived helplessness; young adults' perceived autonomy. The goal is **interdependence**, not abrupt detachment.

KEY TAKEAWAY — Dual focus = change both the young adults (build self-efficacy via Bandura's four sources; career action) and the environment (adult household agreement, housing reframing, parents' own transition). Boundaries without rejection; autonomy with responsibility.

QUESTION 2 • 30 MARKS

Multiple Intelligence, IQ, Gardner & Sternberg — and a “combo” for Singapore

The highest-scoring answer does **not** pit “IQ bad, MI good.” It explains the psychometric evidence for general/broad abilities, credits Gardner's strengths-based breadth, weighs Sternberg's instructional evidence, and proposes an integrated “combo” applied through Singapore's education system.

1. Traditional intelligence / IQ

Modern psychometric intelligence is more than a narrow “book-smart” score: contemporary batteries are commonly interpreted through the hierarchical **Cattell–Horn–Carroll (CHC)** model — broad cognitive abilities that also share substantial general variance (Keith & Reynolds, 2010). Cognitive ability has real predictive validity: a meta-analysis (413,000+ participants) found it the strongest predictor of academic performance among cognitive-ability and Big-Five predictors, with conscientiousness adding an independent contribution (Mammadov, 2022). The limitation is equally important: IQ is not a measure of human worth, motivation, creativity, social competence, character, or opportunity.

2. Gardner's Multiple Intelligences

Intelligence	Core capacity	Childhood example
Linguistic	Use and understanding of language	Writing stories; persuasive speaking
Logical-mathematical	Logical/quantitative reasoning	Solving mathematical patterns
Spatial	Representing/manipulating space	Design, maps, construction
Musical	Sensitivity to rhythm/pitch	Performing or composing
Bodily-kinaesthetic	Skilled movement/coordination	Sport, dance, craft
Interpersonal	Understanding others	Leadership, mediation, teamwork
Intrapersonal	Understanding oneself	Self-reflection, goal-setting
Naturalistic	Classifying the natural world	Identifying plants/animals

- **Strengths:** resists deficit reductionism; a child weak on conventional academics may show sporting, musical, interpersonal, spatial or practical competence — valuable in middle/late childhood, when Erikson's **Industry vs Inferiority** makes competence and self-comparison salient.
- **Limitations:** Visser, Ashton and Vernon (2006) found a large general (g) factor across measures intended to represent the eight domains, challenging the claim of eight psychometrically independent intelligences. MI is *not* learning styles, and its categories must not become new fixed labels.

3. Sternberg's Triarchic / Successful Intelligence

- Three aspects: **analytical** (analyse, compare, evaluate), **creative** (generate novel ideas, handle novelty), and **practical** (apply and adapt in real contexts; tacit knowledge).
- **Evidence:** triarchic instruction improved outcomes across school-based studies (Sternberg et al.), and a 24-study meta-analysis found a positive effect of successful-intelligence training ($g = .63$, falling to $g = .35$ after adjusting for publication bias; Saw, 2021) — stronger intervention evidence than exists for eight independent Gardner intelligences.
- **Limitation:** the three abilities are not cleanly separable — a factor-analytic study found the Sternberg Triarchic Abilities Test largely measures g.

4. Compare, contrast — and the “combo” way forward

Dimension	Traditional IQ / CHC	Gardner	Sternberg
Primary question	How strong across measurable cognitive abilities?	In what culturally valued forms can competence appear?	Can a person analyse, create, and apply/adapt?
Structure	Hierarchical g + broad/narrow abilities	Eight commonly taught intelligences	Analytical, creative, practical

Dimension	Traditional IQ / CHC	Gardner	Sternberg
Main strength	Strong measurement and prediction	Strengths-based breadth	Links intelligence to real-world application/instruction
Main weakness	Can be misused as a total judgement	Weak support for 8 independent intelligences	Independence of the three abilities disputed

Proposed “combo” (integrated) model: (1) *retain validated CHC/psychometric and academic assessment to identify genuine cognitive or learning needs — do not discard IQ;* (2) *teach and assess through Sternberg's triarchic approach (analytical + creative + practical), which has the strongest intervention evidence, so children can demonstrate competence in multiple modes;* (3) *use Gardner's pluralism as a strengths and self-concept frame to broaden mastery opportunities — not as a claim of eight independent intelligences;* and (4) *build efficacy by engineering mastery experiences (Bandura, 1997) so competence is felt, not just labelled.*

Singapore already institutionalises this combo. Full Subject-Based Banding (nationwide from the 2024 Secondary 1 cohort; streams removed; subjects at G1/G2/G3; mixed form classes; a common national examination and certification from 2027) lets a child be strong in some subjects and still stretched in others — reducing labelling and supporting a growth mindset (MOE, 2019/2024). **Direct School Admission** recognises talents in sport, the arts and leadership; **Applied Learning Programmes, Character and Citizenship Education** and **Values-in-Action** widen valued competence; and **SkillsFuture** extends it across the life course. The system operationalises “assessment plus strengths plus varied demonstration.”

5. Application to middle and late childhood in Singapore

Consider a Primary 5 boy scoring below classmates in mathematics who begins saying, “I am stupid.” A weak response merely reassures him he has “bodily-kinaesthetic intelligence” (one label for another). A **combo** response: (a) assess the genuine learning difficulty and collaborate with teachers; (b) engineer **mastery experiences** to rebuild efficacy; (c) use Sternberg to vary tasks (analyse littering causes; design a novel poster; decide where bins go); (d) surface Gardner-style strengths (sport, teamwork, spatial) to protect self-concept; and (e) use DSA/ALP pathways where strengths genuinely justify them. He is not excused from literacy and numeracy — he is given more pathways to competence.

KEY TAKEAWAY — Never write “IQ is obsolete” or “teach to each child's MI learning style.” The defensible position is a **combo**: validated assessment + Sternberg's triarchic teaching + Gardner's strengths framing + engineered mastery — exactly what FSBB/DSA/ALP enable.

QUESTION 3 • 20 MARKS

Appraising “Empty-Nest Syndrome” in Midlife Adults

The empty nest is a real family transition, but an inevitable pathological “syndrome” is not supported by the overall evidence. Mitchell and Lovegreen (2009) operationalised empty-nest “syndrome” as parental depression/distress when children leave, and showed it varies by gender and culture — so it must be understood contextually.

1. Critical appraisal of the evidence

- A representative German longitudinal study found **no adjusted change** in loneliness or depressive symptoms after the nest emptied — the consequences may have been historically overestimated (German Ageing Survey, 2021).
- An 18-year study of women found the opposite marital pattern: empty-nest transition was linked to **increased marital satisfaction**, mediated by greater enjoyment of partner time (Gorchoff, John, & Helson, 2008).
- Recent Thai longitudinal evidence found **increased positive affect** and life satisfaction (women) with no rise in negative affect (Pengpid & Peltzer, 2026).
- Yet distress is real for some: Chinese observational meta-analyses report substantially higher depression among empty-nest older adults, moderated by living alone, chronic illness, low income, weak support and poor child relationships — though the studies are largely cross-sectional.

Appraisal formula: empty-nest outcome = transition × meaning × marital quality × health × resources × continuing child relationship × culture × community support.

2. Implications for the midlife couple

- **Potential loss/grief** where identity was heavily organised around caregiving — stronger when departure is conflictual, the marriage is weak, one spouse has few outside roles, or health/retirement changes coincide; insecure attachment predicts poorer adjustment.
- **Potential renewal** — removing daily parenting demands can renew couple intimacy, leisure and communication; the Gorchoff study located the benefit in *quality* of partner time, not merely more hours.
- Best read as a **restructuring opportunity**: couples with existing strengths may flourish; unresolved conflict can become more visible.

3. Implications for the adult children and community

- **Children:** leaving can support autonomy, financial and household competence, and a more equal adult-to-adult relationship — though physical separation is not identical to psychological independence, and “boomerang” returns (especially of an unemployed child) can reduce parental quality of life.
- **Filial connection without co-residence:** Singapore adults provide substantial upward support (financial, instrumental, contact) that does not require living together (Kim, 2024) — leaving home is not abandoning parents.
- **Community as generativity and buffer:** reduced daily parenting frees capacity for mentoring, volunteering and caregiving; Singapore evidence links HDB-neighbourhood participation and friendship contact to lower social isolation among older adults.

4. Singapore localisation & overall appraisal

- The literal empty nest is often **delayed** in Singapore: the HDB singles rule (age 35) and later marriage (medians 30.8/29.1; SingStat, 2024) keep adult children at home longer even as they mature.
- Living arrangement is not a simple well-being indicator: a longitudinal study found most older Singaporeans co-resided, with complex rather than uniformly positive associations — “a full house can contain loneliness, and an empty house a satisfying marriage.”

KEY TAKEAWAY — Empty nesting is a transition, not an inevitable syndrome: outcomes range from grief to marital renewal and depend on relationships, resources, culture and community. Assess transition quality — don't diagnose from household composition. The question says “appraise,” so weigh positive and negative pathways.

SECTION 4 • RAPID REVISION

One-screen recall across the paper

Q1 — Tan family (Erikson / factors / Arnett / dual-focus)

- **Q1a:** Intimacy vs Isolation; intimacy = reciprocal commitment, not marriage; identity–intimacy overlap (Beyers & Seiffge-Krenke, 2010).
- **Q1b:** biophysical (EF stabilises ~18–20) + psychological (career self-efficacy; Bandura's 4 sources + reciprocal determinism) + social/structural (HDB-35, 3.3% unemployment, marriage 30.8/29.1).
- **Q1c:** Arnett's 5 features applied + critique (culturally contingent, descriptive not causal, age-band, don't normalise withdrawal); Yeo & Yang (2023).
- **Q1d:** dual focus — build self-efficacy via Bandura's 4 sources + WSG; adult household agreement; housing reframing; support parents' transition; directive→consultative.

Q2 — Multiple intelligence

- IQ/CHC = hierarchical g + broad abilities (predictive; Mammadov, 2022). Gardner = 8 strengths (weak independence; Visser et al., 2006). Sternberg = analytical/creative/practical (instructional evidence; Saw, 2021, $g=.63 \rightarrow .35$).
- **Combo:** validated assessment + Sternberg teaching + Gardner strengths framing + engineered mastery (Bandura). Singapore vehicles: Full SBB (2024), DSA, ALP, CCE, SkillsFuture.

Q3 — Empty nest

- Not a universal syndrome: German (no change), Gorchhoff (marital satisfaction up), Thai (positive affect up) vs Chinese meta-analyses (distress in vulnerable subgroups).
- Singapore: HDB-35 and later marriage delay the empty nest; living arrangement $\neq$ well-being; filial support without co-residence; community buffers isolation.

SECTION 5 • ACTIVE RECALL

Flashcards — cover the right column, recall aloud, then check

Q1 — Erikson / factors / Bandura

CUE (recall aloud)	MODEL RECALL (check yourself)
Which Eriksonian crisis fits the Tan children, and what does it really mean?	Intimacy vs Isolation — capacity for committed, reciprocal closeness while keeping a coherent identity; not defined by marriage.
Name Bandura's four sources of self-efficacy (strongest first).	Mastery/enactive experiences (strongest); vicarious experiences; verbal/social persuasion; physiological/affective states (Bandura, 1997).
What is triadic reciprocal determinism?	Person (beliefs), behaviour and environment continuously influence one another — the daughter's withdrawal → parental criticism → lower efficacy → more withdrawal.
Why reject “the brain isn't mature until 25” for Q1b?	A 2023 multi-dataset study (Nature Communications) found measured executive functions largely stabilise ~18–20; it can't excuse financial/interpersonal behaviour.
Two Singapore structural facts that reframe the case.	HDB singles route generally requires age 35; 2024 median first-marriage ages 30.8 (men) / 29.1 (women); resident 25–34 unemployment 3.3%.

Q1c/d — Emerging adulthood & dual-focus

CUE (recall aloud)	MODEL RECALL (check yourself)
List Arnett's five features.	Identity exploration, instability, self-focus, feeling in-between, age of possibilities (Arnett, 2000).
Give two limitations of Arnett's theory.	Culturally contingent (non-universal); descriptive not causal; age band approximate; must not normalise persistent withdrawal.
How does dual focus build the daughter's career self-efficacy?	Bandura's four sources: graded mastery wins; near-peer models (WSG advisors); credible persuasion/coaching; manage job-search anxiety.
What does “directive → consultative” mean here?	Parents move from imposing expectations to negotiating a fair adult household agreement — reciprocity: more autonomy with more responsibility.

Q2 — Multiple intelligence

CUE (recall aloud)	MODEL RECALL (check yourself)
Contrast IQ/CHC, Gardner and Sternberg in one line each.	IQ/CHC: hierarchical g + broad abilities (predictive). Gardner: 8 strengths (weak independence). Sternberg: analytical/creative/practical (instructional evidence).
What did Visser, Ashton & Vernon (2006) find?	A large general (g) factor across measures of the eight domains — challenging eight independent intelligences.
State the “combo” way forward.	Validated assessment + Sternberg triarchic teaching + Gardner strengths framing + engineered mastery; delivered via Full SBB, DSA, ALP.
One MI misuse to avoid.	MI is not learning styles; don't teach every topic through a child's “strength” or turn categories into fixed labels.

Q3 — Empty nest

CUE (recall aloud)	MODEL RECALL (check yourself)
Best verdict on “empty-nest syndrome”?	A transition with variable outcomes, not an inevitable syndrome (German null; Gorchoff marital gain; Chinese distress in vulnerable subgroups).
What did Gorchoff, John & Helson (2008) find?	Empty-nest transition linked to increased marital satisfaction, via greater enjoyment (quality) of partner time.

CUE (recall aloud)	MODEL RECALL (check yourself)
Why is the empty nest often delayed in Singapore?	HDB singles rule (age 35) and later marriage keep adult children at home longer even as they mature.
Community implication for midlife adults?	Freed capacity for generativity (mentoring/volunteering); HDB-neighbourhood participation buffers isolation.

SECTION 5 (CONT.) • SELF-TEST

16-item MCQ quiz — answers on the next page

Q1. The most applicable Eriksonian stage for the Tan children (25, 27) is:

- (a) Identity vs Role Confusion
- (b) Intimacy vs Isolation
- (c) Generativity vs Stagnation
- (d) Industry vs Inferiority

Q2. In 2024, the median age at first marriage for citizen brides in Singapore was about:

- (a) 25
- (b) 27
- (c) 29
- (d) 33

Q3. Bandura's strongest source of self-efficacy is:

- (a) verbal persuasion
- (b) vicarious experience
- (c) mastery/enactive experience
- (d) physiological arousal

Q4. Bandura's four sources are mastery, vicarious experience, physiological states, and:

- (a) verbal/social persuasion
- (b) reinforcement schedules
- (c) punishment
- (d) heredity

Q5. “Triadic reciprocal determinism” refers to the interaction of:

- (a) id, ego, superego
- (b) person, behaviour, environment
- (c) micro, meso, macro
- (d) analytical, creative, practical

Q6. An unmarried single Singapore Citizen can generally buy an HDB flat independently (singles route) from age:

- (a) 21
- (b) 30
- (c) 35
- (d) 40

Q7. Which is NOT one of Arnett's five features of emerging adulthood?

- (a) identity exploration
- (b) instability
- (c) generativity
- (d) feeling in-between

Q8. A key limitation of Arnett's theory is that it is:

- (a) universal across all cultures
- (b) culturally contingent and descriptive rather than causal
- (c) applicable only to women
- (d) unsupported by any evidence

Q9. Shifting parents from directive to consultative mainly changes the:

- (a) young adult's neurobiology
- (b) relational/environmental system
- (c) national housing policy
- (d) labour market

Q10. Modern IQ tests are best described by which hierarchical model?

- (a) Cattell–Horn–Carroll

- (b) Big Five
- (c) SOC
- (d) PPCT

Q11. Visser, Ashton and Vernon (2006) testing Gardner's MI found:

- (a) eight independent intelligences
- (b) a large general (g) factor across domains
- (c) no cognitive structure
- (d) that IQ is obsolete

Q12. Sternberg's triarchic theory comprises analytical, creative and ____ intelligence:

- (a) musical
- (b) practical
- (c) interpersonal
- (d) emotional

Q13. The most defensible “way forward” for intelligence in Singapore schools is:

- (a) abolish IQ testing
- (b) use MI learning styles only
- (c) a combo: validated assessment + triarchic teaching + strengths framing
- (d) rank children by a single g score

Q14. The best evidence-based verdict on “empty-nest syndrome” is that it:

- (a) always causes depression
- (b) always improves marriage
- (c) is a transition with variable outcomes
- (d) does not exist

Q15. Gorchoff, John and Helson's (2008) 18-year study linked empty-nest transition to:

- (a) increased marital satisfaction via better-quality partner time
- (b) severe depression
- (c) divorce
- (d) cognitive decline

Q16. In Singapore, the literal empty nest is often delayed because:

- (a) children never leave
- (b) HDB singles rules and later marriage keep adult children at home longer
- (c) there are no flats
- (d) filial piety is legally required

SECTION 5 (CONT.) • ANSWER KEY

Quiz answers with one-line rationale

Q	Ans	Why
1	b	Young adulthood centres on Intimacy vs Isolation.
2	c	2024 median first-marriage age for citizen brides $\approx$ 29.1 (SingStat).
3	c	Mastery/enactive experiences are the strongest source (Bandura, 1997).
4	a	The fourth source is verbal/social persuasion.
5	b	Person, behaviour and environment reciprocally interact.
6	c	The HDB singles route generally requires age 35.
7	c	Generativity is Erikson's midlife stage, not an Arnett feature.
8	b	Arnett's theory is culturally contingent and descriptive, not causal.
9	b	It restructures the family/relational environment.
10	a	Contemporary IQ tests fit the CHC hierarchy.
11	b	A large g factor emerged across the eight domains.
12	b	Analytical + creative + practical.
13	c	Combine validated assessment, triarchic teaching and strengths framing.
14	c	Outcomes vary; it is not an inevitable syndrome.
15	a	Marital satisfaction rose via better-quality partner time.
16	b	Housing rules and later marriage delay home-leaving.

Scoring: 14–16 = exam-ready; 10–13 = solid, revisit weak items; ≤ 9 = re-read the relevant model-answer section before re-testing. Retrieval practice beats re-reading — cover the flashcard answers and say them aloud.

Singapore policy & data

- Singapore Department of Statistics / National Population and Talent Division. (2024). *Marriage & parenthood* (median age at first marriage). population.gov.sg.
- Housing & Development Board / CPF Board. HDB for singles — eligibility (singles route generally from age 35).
- Ministry of Manpower. (2025). Youth unemployment (resident 25–34 ≈ 3.3%, 2024); Platform Workers Act.
- Ministry of Education. (2019, 2024). *Full Subject-Based Banding*; Direct School Admission; multiple pathways / holistic education.
- Workforce Singapore. Careers Connect; Volunteer Career Advisor Initiative. SkillsFuture Singapore. SkillsFuture Level-Up (age 40+).

Study aid for revision. Empirical associations are population-level and probabilistic; apply them as contributing mechanisms, not deterministic rules for any individual. Verify current figures (marriage medians, HDB eligibility, unemployment, MOE policy) against official SingStat / HDB / MOM / MOE publications before submission, as these are updated periodically.
